

FNTO DI NGEGNERIA CIVILE E AMBIENTALE

# Multi-step Deep Learning-based Reduced Order Models for **Geometric Nonlinearities in MEMS**

Giorgio Gobat<sup>1</sup>, Stefania Fresca<sup>2</sup>, Andrea Manzoni<sup>2</sup>, Attilio Frangi<sup>1</sup> <sup>1</sup>Politecnico di Milano, Department of Civil and Environmental Engineering (DICA) <sup>2</sup>Politecnico di Milano, Department of Mathematics (MOX)

International CAE Conference and Exhibition 2021

#### **Micromirrors Applications**

- The frequency of the torsional mode is 29271 Hz The quality factor has been set to Q = 1000
- Only geometric nonlinearities are considered

Extremely efficient reduced order model able to span the main design parameters

## **Finite Element Model**

- The device geometry is discretised and solved with Finite Element Method (FEM)
- Harmonic balance method is used to • create reference Frequency response Functions (FRF)

## **High Fidelity Snapshots**

3

- Solutions of the FEM for certain  $t, \beta, \omega$
- 2000 snapshots collected 40 frequencies  $\beta = 2,5\mu N$

#### $\mathbf{M} \ddot{\mathbf{D}} + \mathbf{C} \dot{\mathbf{D}} + \mathbf{K}\mathbf{D} + \mathbf{G}(\mathbf{D}, \mathbf{D}) + \mathbf{H}(\mathbf{D}, \mathbf{D}, \mathbf{D}) = \mathbf{F}(\mathbf{D}, \beta, \omega, t)$

D nodal displacement vector F nodal force vector M mass matrix **C** Rayleigh damping Matrix **K** Stiffness matrix G vector related to 2° order monomial H vector related to  $3^{\circ}$  order monomial  $\beta$  load multiplier  $\omega$  external forcing frequency t time  $\mathbf{F} = \beta \mathbf{M} \boldsymbol{\phi}_3 cos(\omega t)$ 

## **POD-Galerkin Exact projection of Geometric nonlinearities** [5]

 $\mathbf{M}^{\text{POD}}\ddot{\mathbf{O}} + \mathbf{C}^{\text{POD}}\dot{\mathbf{O}} + \mathbf{K}^{\text{POD}}\mathbf{Q} + \mathbf{G}^{\text{POD}}(Q, Q) + \mathbf{H}^{\text{POD}}(Q, Q, Q) = \mathbf{F}^{\text{POD}}(Q, \beta, \omega, t)$ 

### **Proper Orthogonal Modes**

- Singular Value Decomposition is used to process the ulletsnapshots
- As results we get V Proper Orthogonal Modes (POMs) matrix used in the Reduced Oder Model (ROM)
- 9 bases are kept in the model •

**Q**= POD subspace coordinate vector  $N_{POD}$  = dimension of the POD-ROM=9

ROM

 $\mathbf{D} = \sum_{i}^{N_{POD}} Q_i V_i$  $\mathbf{M}^{\mathrm{POD}} = \mathbf{V}^T M \mathbf{V}$ 

POMs subspace

 $\mathbf{C}^{\text{POD}} = \mathbf{V}^T \mathbf{C} \mathbf{V}$  $\mathbf{K}^{\text{POD}} = \mathbf{V}^T \mathbf{K} \mathbf{V}$  $\mathbf{F}^{\text{POD}} = \mathbf{V}^T \mathbf{F}$  $G_i^{\rm POD} = g_{ijk}^{\rm POD} Q_j Q_k$ 

## **POD- ROM Snapshots**

Solutions given by the POD-ROM for  $t, \beta, \omega$ 

Proper Orthogonal decomposition (POM)

Since only polynomial nonlinearities are

generates a ROM by projecting the FEM the

involved all the operators are projected, thus

we do not need the FEM system to solve the

- 17 500 training snapshots 175 frequencies on 5 load multiplier values  $\beta = 1, 1.5, 2, 2.5, 3$
- 17 500 verify snapshots 175 frequencies on 5 load multiplier values  $\beta = 1, 1.5, 2, 2.5, 3$

- The decoder nonlinearly reconstructs from  $U_{NN}(t,\omega,\beta)$  to
